

## PRESS RELEASE

### Cyber Group Launches CyGOS™, a Comprehensive Surveillance & Security System Integration Platform for a Wide Variety of Applications

*Delivers Analog & IP Video, Audio and Data Over AC Power Line LANs*

(DALLAS, TEXAS – JANUARY 21, 2009) - Cyber Group, Inc. ([www.CyberGroupUSA.com](http://www.CyberGroupUSA.com)), a global provider of engineering solutions for software, electronic products and systems in business, government and public safety applications, announced today that it has launched CyGOS™.

CyGOS™ is a comprehensive surveillance and security system integration platform for a wide variety of applications that delivers analog and IP video, audio and data over AC power line LANs.

“CyGOS™ eliminates the need for organizations to make costly transitions from analog video cameras to IP video cameras because CyGOS™ transforms analog video, audio and data signals into IP signals,” said Tom Hulseley of Cyber Group. “CyGOS™ open-standards architecture enables organizations to optimize their existing investment in analog cameras, deploy additional analog or IP cameras (and other analog or IP devices) on the same AC power line LAN while realizing the benefits of IP technology.”

CyGOS™ is designed to provide video and audio surveillance, along with data and control, in places where digging, trenching and breaching of walls to install additional video and data cable, as well as where line-of-sight obstructions prevent the effective use of wireless solutions. Prime examples are parking garages and elevators.
